

## National Grass Seed Feedback Report Model B

Carcases from this consignment of lambs (PIC Number, Trading Name, contract/consignment number) processed today at **REALLY GOOD MEAT COMPANY** were contaminated with seeds.

Carcases are considered seed contaminated, as judged by *Really Good Meat Company* assessors, if there is sufficient grass seed to cause trimming to product or disruption to processing throughput. Disruption may include increased labour requirements, slowing of the processing chain or movement of the carcasses to the retain rail (where further processing is required).

**REALLY GOOD MEAT COMPANY** has provided photos of example carcasses from your consignment with this feedback report.

**NOTE: Grass seeds are trade access risk to Australia's lamb export markets and may have reduced the growth potential of your lambs.**

Date: 15/2/2016

No. Processed: 650

Owner Lot No. 123

Works Lot No. 567

Producer John Smith

NVD No. 1245678

PIC No. NA123456

	Impact on Carcase Value			
	No Seed	Low (minimal seed)	Moderate (flank, brisket)	High (flank, brisket, shoulder, leg/loin)
Percentage of Mob	80	5%	10%	5%

Was this a 'trial seed kill' (circle)  Yes / No

**Definitions**

<p><b>Low</b> (Seed in Section 3 only)</p>	<p><b>Moderate</b> (Seed in Section 2 belly, flank, shoulder and, brisket)</p>	<p><b>High</b> (Seed in Section 1 flank, brisket, shoulder, leg/loin)</p>
--	--	---

In this reporting sheet

- carcasses that have grass seeds but they are easily removed in the normal trimming process are not considered to have reportable grass seed contamination
- carcasses that are sent to the retain rail because of grass seed contamination or any carcasses that requires additional trimming for grass seed contamination are regarded as having grass seed contamination.

If grass seed only occurs in the belly and flank then it is regarded as **low levels** of contamination.

If grass seed only occurs in the belly, flank, shoulder and brisket then it is regarded as **medium levels** of contamination

If grass seed occurs in the flank, brisket, shoulder, leg/loin then it is regarded as **high levels** of contamination.
